

Durbin-Watson Test

H_0 : There is no autocorrelation

H_1 : There is autocorrelation

$$d = 0.05$$

Test-statistic

$$d = \frac{\sum (e_i - e_{i-1})^2}{\sum e_i}$$

Conclusion

- Q. In an experiment to measure the stiffness of a spring the length of the spring under different loads was measured. The regression equations appropriate for predicting the length on the basis of weight is

$$\hat{y} = 8.74 + 1.62x$$

(weight)

the ^(length) residual and the ^(weight) observed data are as follow

| | | |
|----|----|---------|
| X | Y | e |
| 3 | 10 | -1.8494 |
| 5 | 12 | -1.8796 |
| 6 | 15 | 0.1053 |
| 9 | 18 | 0.0602 |
| 10 | 20 | 1.0451 |
| 12 | 22 | 1.0151 |
| 15 | 27 | 2.9699 |
| 20 | 30 | 0.8946 |
| 22 | 32 | 0.8645 |
| 28 | 34 | -3.2257 |

28 34 - 3.2257

Test the autocorrelation using Durbin-Watson Test at 5% level of significance.
